

Alessandra Ghigo is Associate Professor of Applied Biology at the Department of Molecular Biotechnology and Health Sciences of the University of Torino. She is best known for her work on the crosstalk between phosphoinositide 3-kinase (PI3K) and cyclic nucleotide signaling pathways in heart failure and arrhythmias. Her recent interest is the comprehension of the molecular mechanisms underlying the cardiotoxicity of anti-cancer therapies, with a major focus on the contribution of PI3K enzymes. She is author of more than 90 publications in highly reputed journals, including *Science*, *Science Translational Medicine* and *Circulation*. She is invited speaker in prestigious conferences including meetings of the American Heart Association, the European Society of Cardiology and the International Society for Heart Research. She is co-founder and Scientific Advisor of Kither Biotech, a biotechnology company developing PI3K inhibitors for the treatment of respiratory diseases.
